

Abstract of the Disclosure

A communication such as a telephone call is received, bearing identification information such as caller ID. The received audio signal, if any, is encoded and stored. The identification
5 information is used to look up additional information about the sender of the communication, such as by using the caller ID information to search the internet, for example by doing a reverse telephone number lookup. The user is presented with a graphical representation of this, and prior, communications, such as via an html page, and can select individual communications for playback, deletion, and the like. If the user is at a remote location, the encoded communications may be
10 forwarded to that location, such as in the form of email attachments.
